                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a preferred target sequence for an enzymatic mucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the mucleotide base position indicated in the DE line.
Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis.
Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriassis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozymes having modified bases and methods for producing them for use in inhibiting disease related genes

                                                                                                                                                                                                                                                                                                         Gaps
      The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TMR-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme alterway sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TMF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as

Human TNF-alpha hammerhead ribozyme target sequence (nt position 1274).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNR-alpha manh, the nucleotide base position indicated in the DE line.

Regions of the manh that do not form secondary folding structures and that contain potential hammerhead and hairpin informate cleavage sites were identified by computer analysis.

Tibozymes directed against these manh sequences were designed and shows directed against these manhs sequences were designed and synthesised with modifications that improve their nuclease synthesised with modifications that improve the target sequences and thereby inhibit TNF-alpha expression, making them cequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS.

(Cupdated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TWR-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis Ribozymes directed against these tRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the trarget sequences and thereby inhibit TWF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ribozymes having modified bases and methods for producing them for use in inhibiting disease related genes

                                                                                                                                                                                                                                                                                                                                                                                                                            Human TNF-alpha hammerhead ribozyme target sequence (nt position 1261).
                                                                                                                                                                                                                                               Gaps
                           The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNR-alpha maRNA at the nuclectide base position indicated in the DE line. Regions of the maRNA that do not form secondary folding structures and that contain potential harmerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozyme cleavage sites were identified by computer analysis. Synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNR-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition, gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virue; RSV; borr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atheroselerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Kawaeaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome;

Human TNF-alpha hammerhead ribozyme target sequence (nt position 1262).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ic J, Mcswiggen JA;
Sweedler D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNP-alpha mRNA at the nucleotide base position indicated in the DB line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bnzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; INP-alpha; respiratory syncytial virus; RSV; bor-abl; oncogene; translocation; chromic myelogenous leukaemia; CML; cancer; philadelphia chromosome; inflammation; autoimmune disease; atheroscierosis; myecardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential harmerhead and hairpin. Thosymes cleaves and that contain potential harmerhead and hairpin. Ribozymes directed against these mRNA sequences were designed asynthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid architis, septic shock and other inflammatory disorders including psoriasis, as well as
Ribozymes having modified bases and methods for producing them for use in inhibiting disease related genes

The sequences given in AAT40324-26 represent primer sequences that
were used to optimise DNA cleavage activity of the enzymatic RNA
molecule of the invention. Primer la hybridises to the 3' portion
of the substrate that becomes attached to the 3' end of the ribozyme.

Primer 1b hybridises to the 3' portion of the ribozyme when no substrate
or product remains attached. Primer 2 hybridises to the 3' end of the
resulting cDNA and introduces the 77 promoter sequence. The self-
splicing group I introm of the invention is based on the large ribosomal
RNA precursor from Tetrahymena thermophila. The biological function of
this molecule is to catalyse its own excision from precursor RNA, to
produce mature RNA. The Tetrahymena wild type sequence was used in
the design of the enzymatic RNA molecules of the invention. A number
of mutations are listed in the specification which improve the enzymatic
properties of this molecule, e.g. G444A, G191U, U190A and A314G. The
modified enzymatic molecules may be used as medical or pharmaceutical
agents for use in anti-viral agents, food products, personal care
                                                                                                                                                                                                                                                                          Wild type; self-splicing group I intron; large ribosomal RNA precursor; Tetrahymena thermophila; catalysis; enzymatic RNA; food product; anti-viral agent; mutation; personal care product; cleaning agent; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAT40327-30 represent sequences that were used to optimise DNA cleavage activity of the enzymatic RNA molecule of the invention. The 3' potion of the substrate was transferred to the 3' terminal G of the ribozyme and amplification was performed. The product of the reaction was a molecule which contained the 3' portion of the substrate attached to the 3' end of the ribozyme. Selection occurred when a primer was hybridised across the ligation junction and used to initiate cDNA synthesis. The primer does not bind to unreacted starting materials and thus led to selective amplification of the catalytically active RNA; a The self-splicing group I intro of the invention is based on the large riboscal RNA precursor from Tetrahymena thermophila. The biological function of this molecule is to catalyse its own excision from precursor RNA to produce mature rRNA. The Tetrahymena wild type envention. A number of mutations are listed in the specification which improve the enzymatic properties of this molecule, e.g. G444A, G191U, U190A and A314G. The modified enzymatic molecules, e.g. G444A, G191U, products, personal care products or cleaning agents, food

                                                                                                                                            DNA probe AIT-3 (AAT16099) is complementary to the AUUUA motif common to the 3' non-translated region of cytokine mRNAs. It was used to screen a cDNA library prepd. From human bone marrow stromal KM-102 cells. A cDNA sequence (AAT16092) coding for a novel dichloroindophenol- and glutathiona-reducing protein, KM11-7 (AAR92050), was obtd. This can be used to treat diseases related to oxidative stress or caused by activated oxygen.
                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
Clover yellow vein virus nuclear inclusion and dischlorosindophenol or oxidised glutathione reducing protein - useful in autolyshing fusion protein expression systems and for treating diseases related to oxidative stress, or caused by activated oxygen, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                             ö

This sequence is a primer for a wild type tetrahymena ribozyme L-21 form.

The amplified sequence is an example of a catalytic RNA (1) of the invention, which catalyses site-specific cleavage of nucleic acid under physiological conditions includes a sequence derived from a group I bysiological conditions includes a sequence derived from a group I intron. Similar catalytic RNAs (II) which catalyse hydrolysis of amide can are useful as peptidases and proteases, e.g. in wound debridement, clot dissolution, in detergents or as a meat tenderiser. (I) cleave single- and (partly) double-stranded nucleic acids in vitro or in vivo, and are potentially useful as antiviral agents and gene regulators; also to generate defective but still immunogenic viruses (for vaccines); clagmostically to detect mutations in nucleic acid or to identify nucleic acid binding agents; to modulate/terminate reactions initiated by DNA primers; to generate truncated transcripts from DNA; to modulate therapeutic/diagnostic processes using antisense sequences; in DNA in vitro evolution processes that provide better catalytic performance; broader active temperature and pit ranges; new enzymatic activities or specificities; altered recognition sites or co-factor requirement.
                                                                                                                                                                                                Catalytic RNA for site-specific cleavage of nucleic acid or hydrolysis of amide bonds - and ribozyme amidase intermediates, useful e.g. as peptidase(s), antiviral agents and gene regulators
                                                                                                                                                                                                                                                                                                       Example 1; Page 90; 215pp; English

Melanoma differentiation associated gene-7 promoter capable of treating cancer comprises directing transcription of heterologous coding sequence encoding tumour suppressor polypeptide positioned downstream, useful for treating cancer -

Disclosure; Fig 2C; 132pp; English.

The present sequence is that of an AU-rich sequence in the 3' untranslated region (3'UTR) of human interferon-alpha mRNA. The presence of AU-rich elements (ARSB) in eukaryotic mRNAs. The presence of AU-rich elements (ARSB) in eukaryotic mRNAs correlates with rapid mRNA turnover and post-translational control. The ARB consists of multiple AUUNA motifs or sequences resembling it. A sufficientiation associated gene-7 (Mda-7) gene (see AAH26596). The invention provides recombinant expression constructs in which the human Mda-7 promoter (see AAH36595) is operably linked to a coding sequence encoding a tumour suppressor protein. Sparascian construct is used in a claimed method of treating melanoma, construct is used in a claimed method of treating melanoma, neuroblastoma, astrocytoma, glioblastoma multiforme, cervical cancer, breast cancer, octonaryous system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            쉽
                                                                                                                                                                                                   This invention relates to a polynucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence also referred to as cyclooxygenase 2. The human PTGS2 gene sequence.

AAP80895 contains 27 single mucleotide polymorphisms (SNPB). AAP80896 and AAP80897 represented by AAB72199. The invention includes PCR and contains in represented by AAB72199. The invention includes PCR and probes represented in AAP80898 - AAF81151 which are used to isolated and characterise the PTGS2 gene sequence, and to locate the positions of the SNPB. PTGS2 proteins and plymich of care used to express variant PTGS2 proteins, for structural analysis or drug-binding studies and also in gene therapy (either carpies) in progness, progness and also in gene therapy (either carpies) progness and unbit of sead against PTGS2 are expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are known, polymorphisms and used to determine PTGS2 haplotype and genotype, consetul for diagnosis, prognesis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 but also disease for a succeptibility, severity or stage. Anti-PTGS2 antibodies are particularly cused for developing diagnostic tests and treatments for immune-related disorders such as arthritis and inflammation. The polymorphisms may also the used to study expression and biological function of PTGS2 ranageming affects of the service of the present of the progressing and testing, and for assessing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Pactor [IGF]-1 inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be useful of sequence is an oligonucleotide which can be useful for ameliorating the effects of AAF4515-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityridasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasas, scleroderma, warts, benign growths, cancers of the skin, a hyperneovasquiar condition such as a neovascular condition of the method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense therapy, antiproliferative, antiinflammatory; antipsoriatic; cytostatic; dermatological, cardiant; virucide; ophthalmological, keloid; skin disorder; Insulin-like Growth Factor 1 receptor; IGF-1; pityriasis; IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; prowth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hypernecvascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia.
                                                                                                                      antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antison nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .,

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligomucleotide which can be used to design the antisense oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, bengan growths, cancers of the retina, brain or skin, growth factor-mediated malignancies, other retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation -

Sxample 7; Page 59; 201pp; English.

The present invention relates to a method for ameliorating the

A314G. The modified enzymatic molecules may be used as medical or pharmaceutical agents for use in anti-viral agents, food products, personal care products or cleaning agents.

antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be useful for amaliorating the effects of AAF45151 and AAF45151-R45161. The method is useful for amaliorating the effects of keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, canners of the skin, a hyperneovascular condition such as a neovascular condition of the

The evolution experiment spanned 10 successive generations and catalytic activity was deduced after each generation. The self-splicing group I intron of the invention is based on the large function of this molecule is to catalyse its own excision from precursor rRNA to produce mature rRNA. The Tetrahymena wild type sequence was used in the design of the enzymatic RNA molecules of the invention. A number of mutations are listed in the specification which improve the enzymatic properties of this molecule, e.g. G444A, G191U, U190A and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wild type; self-splicing group I intron; large ribosomal RNA precursor; Tetrahymena thermophila; catalysis; enzymatic RNA; food product; anti-viral agent; mutation; personal care product; cleaning agent; ss.

The sequences given in AAT40327-30 represent sequences that were used to optimise DNA cleavage activity of the enzymatic RNA molecule of the optimise DNA cleavage activity of the enzymatic RNA molecule of the invention. The 3' potion of the substrate was transferred to the 3' terminal Go of the ribozyme and amplification was performed. The product of the reaction was a molecule which connained the 3' portion of the substrate attached to the 3' end of the ribozyme. Selection occurred when a primer was hybridised across the ligation junction and used to initiate cDNA synthesis. The primer does not bind to unreacted starting materials and thus led to selective amplification of the invention is based on the large ribosomal RNA precursor from Tetrahymena thermophila. The biological function of this molecule is to catalytically crive precursor RNA to produce materials for the arranymena wild type sequence was used in the design of the enzymatic RNA molecules of the invention. A number of mutations are listed in the specification which invention. A number of mutations are listed in the specification which inspond and A314G. The modified enzymatic molecule, e.g. G444A, G191U, U190A and A314G. The modified enzymatic molecules may be used as medical or pharmaceutical agents for use in anti-viral agents, food products, personal care products or cleaning agents.
                                                                                                                                                                                                                                                                               wild type; self-splicing group I intron; large ribosomal RNA precursor; Terrahymena thermophila; catalysis; enzymatic RNA; food product; anti-viral agent; mutation; personal care product; cleaning agent; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a primer for a wild type tetrahymena ribozyme I-21 form. The amplified sequence is an example of a catalytic RNA [1] of the cinvention, which catalyses site specific cleavage of muclaic acid under physiological conditions includes a sequence derived from a group I intron. Similar catalytic RNAS [1] which catalyse hydrolysis of amide cands are useful as peptidases and proteases, e.g. in wound debridement, clot dissolution, in detergents or as a meat tenderiser. [1] cleave single- and (partly) double-stranded nucleic acids in vitro or in vivo, and are potentially useful as antiviral agents and gene regulators; also to generate defective but still immunogenic viruses (for vaccines); diagnostically to detect mutations in nucleic acid or to identify nucleic acid binding agents; to modulate/terminate reactions initiated by DNA primers; to generate truncated transcripts from DNA; to modulate truncated transcripts from DNA; to modulate truncated transcripts from DNA; to modulate from processes using antisense sequences; in DNA fingerprinting and for vector construction. [1] and [1] are produced by in vitro evolution processes that provide better catalytic performance; broader active temperature and pH ranges; new enzymatic activities or specificities; altered recognition sites or co-factor requirement.

This is possible as uteroglobin binds to fibronectin, preventing the complexing of fibronectin with igA and the deposition of immune complexes in the kidney.
                                                                                           Mouse; uteroglobin; immunoglobulin A mediated disease; IgA nephropathy; autoimmune disorder; pulmonary inflammation; Wegener's granulomatosus; Goodpasture's disease; diabetic glomerulosclerosis; PCR primer; ss.

                                                                                                                                                                                                                                                                                                  The DNA probe and corresponding probes covering the degenerate sites (AAA78885-Q78890) correspond to amino acids 17-22 of the H. grisea glucoamylase peptide GA1 (AAR6293), and are used as hybridization probes to detect and isolate H. grisea glucoamylase DNA in a Southern blot. Resulting genomic DNA fragments are excised and cloned in plasmid pRSH1. This illustrates the main claims of the patent, i.e. a vector containing (i) DNA encoding a neterologous polypeptide (chymosin, prochymosin, preprochymosin, Aspergillus niger glucoamylase, H. grisea glucoamylase, or Mucor miehei carboxyl proteases and (ii) a secretory signal peptide, and a filamentous fungus (Aspergillus, Trichoderma, Neurospora, Podospora, Endothia, Mucor, Cochiobolus or Pyriclaria, especially A. nidulans, A. awamori or T. reesei) transformed with the vector (updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enzyme; bioluminescence; luminescence; label; DNA probe;
                                                                                                                                                                                                                  Vectors and DNA for expressing polypeptide(s) in filamentous fungi-include secretory signal sequences that are native or foreign to heterologous polypeptide(s), such as chymosin or glucoamylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angloplasty, and in cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding i or more receptors of vascular endothelial growth factor (VBGF). A patient (preferally human) having a condition associated with the level of the fms-like tyrosine kinase i (fil-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase I (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAK77275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flx-1; KDR; hammerhead riboxyme; hairpin riboxyme; oleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular desase; tumour tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ō
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mouse flt-1 VEGF receptor hammerhead ribozyme substrate #596.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fime-like tyrosine kinase 1 (file-1), kinase insert domain containing receptor (KDR) and/or feetal liver kinase 1 (file-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the mucleic acid molecule or the expression vector to the patient. AAX6775 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                      Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesia; psoriamis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinaee 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (YBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (YBR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the mucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                     Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Allele-specific oligonuclectides (ASOs) (AAT60210-41) representing known cystic fibrosis mutations, and corresponding ASOS (AAT60242-70) representing wild-type sequences, are examples of ASOs that can be used in a multiplex allele-specific diagnostic assay (MASDA) that has the capacity to analyse over 500 samples of a large number of mutations (over 100) in a single assay. Target DNA is immobilised to a solid support and interrogated in combinatorial fashion with a mixture of mutation-specific ASOs in solution. The ASO(s) or corresponding to the specific mutation(s) present in the sample is corresponding to the specific mutation(s) present in the sample is corresponding to the specific mutation(s) is identified. MASDA can be used to detect genetic alterations associated with genetic disorders, to identify genetic polymorphisms, to determine the molecular basis of genetic diseases, or for high-resolution of disease-causing microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cyrostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; porians; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying genetic alterations or target sequences in nucleic acid samples - useful for detecting genetic alterations associated with a disease, e.g. cystic fibrosis and sickle cell anaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present invention describes enzymatic nucleic acid molecules with RNA clearing activity, which specifically cleave RNA encoded by an aryl RNA clearing activity, which specifically cleave RNA encoded by an aryl gene, an integrin submuit beta 3 gene, an integrin submuit beta 3 gene, an integrin alpha 6 submuit gene, or a Tie-2 gene. AAA16775 to AAA1762 represent ribozyme sequences for AAA1768 represent their corresponding target sequences; AAA19155 to AAA19156 and AAA1768 to AAA19155 and AAA31915 to AAA19155 to AAA19159 represent ribozyme sequences for integrin alpha 6 submuit, and AAA20362 to AAA2130 and AAA21596 to AAA21468 represent ribozyme sequences for integrin alpha 6 submuit, and AAA20362 to AAA2130 and AAA21596 to AAA2150 and AAA2130 to AAA21305 represent ribozyme sequences for integrin submuit beta 3, and AAA21365 represent ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARRY, or are at cancer, diabetic retinopathy, age related mecular degeneration (ARW), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiotistome of tuberrous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, dintegrin submuit alpha-6, or the levels of ARRY, Tie-2, integrin submuit alpha-6, or the levels of ARRY, Tie-2, integrin submuit beta-3.
                                                                                                                                                                                                                                                                                             Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an anglogenic factors
                                                                                                                                                                                                                                                                                                                                                                  Claim 55; Page 193; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Pydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1767 to AAA1765 to AAA1762 represent ribozyme sequences for ARNY, corresponding target sequences; AAA1768 to AAA1968 to AAA2169 to AAA234 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl RNA cleaving activity, which specifically cleave RNA encoded by an aryl wide control of the submit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17661 to AAA17622 represent ribozyme sequences for ARNT, and AAA17167 and AAA17168 to AAA196775 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19223 represent their corresponding target sequences. AAA19223 to AAA21681 represent ribozyme sequences. AAA19223 to AAA21681 represent ribozyme sequences. AAA21689 represent their corresponding target sequences. AAA21689 to AAA21681 represent their corresponding target sequences. AAA21689 to AAA21687 and AAA21689 represent their corresponding target sequences. AAA21689 to AAA21687 represent their corresponding target sequences. AAA21689 to AAA21687 and AAA2263 to AAA21689 to AAA21689 represent their corresponding target sequences. AAA21689 to AAA21689 represent their corresponding target sequences. Ctor integrin subunit beta 3, and AAA22476 to AAA23342. Represent ribozymes of the invention are used for modulating the sequences. The ribozyme sequences capped in subunit beta 3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer. diabetic retinopathy, age related manual degeneration (ARMD), inflammation, and arthritis, as well as neovascular degeneration (ARMD), inflammation, and arthritis, as well as angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber. Syndrome, Kippel-Trenaunay.Weber syndrome, osler-Weber-Remin sphunit alpha-6, or Tie-2, and degeneration granic scheme stains, Sturge Webr. Andath and degeneration (ARMD), inflammation, and arthritis, as well as and other syndromes and diseases related to the levels of ARMT, Tie-2, incertin subunit alpha-1 per all and other syndromes and other syndromes and elected to treat cancer and other levels of ARMD, Tieintegrin subunit alpha-6, or integrin subunit beta-3.

(first entry) 19-JUN-2000

AAA21376;

The present invention describes enzymatic nucleic acid molecules with RA cleaving activity, which specifically cleave RNA encoded by an aryl Nadrocearbon nuclear transporter (ARNY) gene, an integrin submuit beta 3 gene, an integrin submuit beta 3 gene, an integrin submuit beta 3 corresponding to AAA17561 and AAA1762 represent ribozyme sequences for AAA19155 to AAA19155 to AAA191522 represent this corresponding target sequences; AAA19152 to AAA19155 and AAA19155 to AAA19155 and AAA19155 to AAA19155 and AAA19155 to AAA19155 to AAA19155 to AAA19155 to AAA19155 to AAA19155 and AAA19155 to AAA2168 to AAA2161 and AAA22476 to AAA2342 represent their corresponding target sequences. C to integrin submit beta 3, and AAA22476 to AAA23262, AAA2333 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin submit beta-3, integrin submit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARND), inflamation, and arthritis, as well as madoche to treat cancer, diabetic retinopathy, age related and diseases related to the levels of ARNT, Tie-2, and diseases related to the levels of ARNT, Tie-2, and disease related to the levels of ARNT, Tie-2, and disease related to the levels of ARNT, Tie-2, and disease related to the levels of ARNT, Tie-2, and disease related to the levels of ARNT, Tie-2, and disease related to the levels of ARNT, Tie-2, and di ö Human; aryl hydrocarbon nuclear transport; ARNT; TIB-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; harmerhead ribozyme; angiogenic factor; cytostatic; antidabetic; ophthalmologic; antinflammatory; antiarthritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; poriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-whne stain; Sturge Weber syndrome; Rippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss. ```
The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Nydrocarbon muclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin subunit peets 3 gene, an integrin alpha 6 subunit gene, or Tie-2 gene. AAA16775 to AAA17165 and AAA1768 to AAA1768 to AAA196775 to AAA19155 to AAA191560 and AAA17685 to AAA19185 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19187 to AAA19185 to AAA19182 represent their corresponding target sequences; AAA19185 to AAA21889 to AAA21889 to AAA2189 represent their corresponding target sequences; AAA21689 to AAA2188 represent their corresponding target sequences; AAA21689 to AAA2188 represent their corresponding target sequences for integrin subunit beta 3, and AAA22476 to AAA23342 to AAA23343 to Ct and AAA2189 to AAA22263 to AAA23342 to AAA23343 to Ct and AAA2189 to AAA23283 to AAA23342 represent their corresponding target sequences for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to the invention are used for modulating the sequences. The ribozymes of the invention are used for modulating the subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as corresponding angiofibrome of tuberous sclerosis, potwine stains, sturge Weber corresponding the syndrome, sippel-Trenaumay-Weber syndrome, osler-Weber-Rendu syndrome, there syndromes end diseases related to the levels of ARMT, Tie-2, theories and other syndrome, when the syndrome, when the syndrome of the tender cancer in them the levels of ARMT, Tie-2, theorem.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   integrin subunit alpha-6, or integrin subunit beta-3.

The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. BAR3/COUP-TR-1, the GATA transcription factor gene, IRP-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                             The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of exythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                   Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB88519 to ABB88520). HTPL has two isoforma, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is
The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor. BAR3/COUP-FP. 1, the GATA transcription factor gene, IRR-2 and/or the CAAT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, gene therapy, tumour suppressor, HTPL, chromosome 10p12.1; human teetis expressed Patched like protein, testis; adrenal, liver; human teetis expressed Patche bone marrow, brain; kidney, lung; placenta; prostate; skeletal muscle; colon; male infertility; cancer; ss.
                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL -

mapped to human chromosome 10pl2.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in thesapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The

shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (IRG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous selevosis; port-wine stain; wound healing; sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; Osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber
                                                                                                                                                                                                                                                                                                                                                                                           Gaps

cc vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge veber syndrome, Kippel-Trenaumay-Reber syndrome, Osle-Weber-rendu comparise, Rippel-Trenaumay-Reber syndrome, Osle-Weber-rendu comparise, Sturge syndrome, Leukaemia, osteoporosis and wound healing. [I] is useful for treating a patient having a condition associated with the level of ERG, comparating cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour comparises the use of one or core therapies comparating comparises the use of one or core therapies complunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a coll of seasos related to the expression of ERG, and as diagnostic tool to diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG funding antisense and ABKI7354-ABKI2719 represent nucleic acids, including antisense and centared PCR primers of the invention.

Von Carlowitz I, McSwiggen JA, Mclaughlin F, Randi AM;

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber

Claim 4; Page 63; 149pp; English.

The invention relates to a nucleic acid colecule (I) which down regulates corpression of an Ebe-related gene (ERG). (I) is useful for treating.

Conditions selected from cancer, lymphoma, Bwing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions angiofibroma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma, of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting calls of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies to the treatment. The method comprises the use of one or more therapies or under conditions suitable for the treatment is eukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or call, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of advalent coll to diseases related to the expression of RRG, and as diagnostic coll to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically creating genes that share homology with RRG gene or ERG fusion genes. ABRIJ354-ABRIZ279 represent nucleic acide molecules which regulate expression of ERG, and created PCR primers of the invention.

                                                                                                                                             WPI; 2003-313353/30
   The present sequence represents a PCR primer used to screen a panel of CDNA libraries to determine a source for further cloning of novel CDNA libraries to determine a source for further cloning of novel CDNA libraries to determine a source for further cloning of novel CDNA libraries to determine a thrombospood in ABA02549) that cancedes the ADAM (A Disintegrin And Metalloprotease) family of metalloproteases, and contains a thrombospondin domain (TS). The specification describes a newly isolated polymuclectide, comprising a mucleotide sequence encoding an ADAMTS-M polypeptide as given in the specification, or a metalloproteinase, disintegrin domain, prodomain or its thrombospondin submotif. The polymuclectide, polypeptide and agent care useful for manufacturing a medicament for treating activity or expression of ADAMTS-M. The polymuclectide, and agent or are useful for manufacturing and agent are useful for manufacturing a medicament of a ltering activity or expression of ADAMTS-M. The polymuclectide, not a medicament of a ltering activity or expression of ADAMTS-M. The polymuclectide, organ transplant toxicity and rejection, cachesia, allergy, cancer (e.g. cogan transplant toxicity and rejection, cachesia, allergy, cancer (e.g. coing tumour cancer including colon, breast, lung, prostate, brain or haematopoietic malignancies including leukaemia and lymphoma), corpusorosis, atherosolerosis, aortic aneurysm, congestive heart failure, meurodegenerative disease, autoimmune disorders, Huntington's disease, abnormal wound healing, burns, infertility or diabectic shock. The polymuclectide and polypeptide are also useful for diagnosing the polymuclectide and polypeptide are also useful for diagnosing the construction when the since a lago useful for diagnosing the construction when the since a lago useful subsection in the polymosories and the polymosories and polymosor
                                                                                                        New polynucleotide, useful in gene therapy, particularly for treating or preventing e.g. arthritis, Crohn's disease, Alzheimer's disease and organ transplant toxicity and rejection, comprises ADAMTS polynucleotide and encoded polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diseases above. The polynucleotide is for treating the diseases cited above.
                                                                                                                                                                                                                                                                                           Example; Page 13; 31pp; English

```
consecutive nucleotides from the 17 mer sequence, a sequence with, after consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, collapsed that are characterised by development of tumours or cell preparation, specificalls for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and attent samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequence represents a tumour suppression characterial human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                            The invention relates to a novel isolated 17 mer nucleic acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
New isolated mucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after contecutive nucleotides from the 17 mer sequence, a sequence with, after contecutive nucleotides from the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagants, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticials for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell desentation, specifically cancer but also Alzheimer's disease and schints analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and chops. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonuclectide of the invention. New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells -Disclosure, Page 113; 720pp; French Telerman A, Amson R, Tuijnder M; WPI; 2003-313353/30.

New isolated mucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells

Disclosure, Page 647; 720pp; French

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence that uncleotides from the 17 mer sequence, a sequence that nybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding NNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, and for production of recombinant polypeptides. Any of the nucleic acids, onlypeptides, vectors containing the nucleic acids, colls containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids, cells containing the nucleic acids of preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that an characterised by development of tumours or cell diseases the polypeptides can also be used to generate antibodies, and patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention.

                                                                                                                                                                                             The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The mucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABESSB89 - ABESGESIG, ABESGESIG, ABESGESIG, ABESGESIG, RESESSII, sequences for the human ribozymes of the invention.
Novel short interfering RNR and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape

The FRI gene encodes a polypeptide capable of specifically altering the flowering time of a plant. The FRI polymucleotide is used to transform plants, so that the flowering time of a plant is altered. This is used, for example, for plants in which the leaves or tubers are a commercial product, where it is desirable to avoid 'blotting' (initiation of flowers and stem elongation) at too early a stage. Conversely, it may be desirable to alter flowering under certain circumstances e.g. to vary
                                                                                                                   H51; one locus-FRIGIDA; FRI gene; flowering time; blotting;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compound which modulates human sentrin expression, useful for treating diseases associated with sentrin expression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an antisense compound (I) 8-30 nucleotides long targeted to a nucleic acid molecule encoding human sentrin. The antisense compound comprises a phosphorothicate antisense oligonucleotide which inhibits expression of human sentrin. (I) is useful for inhibiting expression of sentrin in human cells or tissues in vitro, for treating humans or other animals suspected of having or being prome to a disease associated with sentrin expression. (I) can also be used for research or diagnostic purposes. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity -
High density lipoprotein-cholesterol; HDL-C; cardiovascular; ABC1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or ardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition sele lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                feast, platelet activating factor acetylhydrolase, PAF-AH; 8s;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1.1%; Score 13.4; DB 1; Length 18; 93.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for preventing diabetes mellitus comprising administering a platelet activating factor acetylhydrolase (PAF-AH) product to a subject at risk of developing diabetes mellitus. The method is also used to slow the progression of diabetes mellitus in a patient suffering from the disease. This sequence represents a Saccharomyces cerevisiae PAF-AH DNA related oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
```

The invention relates to the isolation of polymorphic repeat sequences

```
ô
having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65098-T66047 were used to PCR amplify the inserts from the isolated clones containing the repeat sequences. The primers AAT66012-3 were used to amplify the repeat sequence marker clone Midlo8 (AAT65779).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DAX02153-X02161 are primers used in a method for detecting one or more base-pair mutations in a nucleic acid sequence by differentiating heteroduplexes from homoduplexes. The method involves generating homoduplexes and heteroduplexes in a sample and performing gel electrophoresis on the sample using a polyacrylamide gel that causes heteroduplexes to migrate more slowly than homoduplexes. The gel comprises 3-20% polyacrylamide, 1-50% of at least one denaturing eslected from alibhatic alcohols, cyclic alcohols, alicyclic compounds, amides, ureas and carbamates, 10-100 mM borate-free TB [Tris-HCl, BDTA] buffer, and 10-100 mM taurine. The method has a high reliability and can be improved by allowing for the presence of the mutations in domains with high melting temperatures. These primers can specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              IVS17 acceptor splice site; PCR primer; detection; base-pair mutation; heteroduplex; homoduplex; migration; ss.

AAZ69579 to AAZ71440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

                                                                                                                                                                                                                                          The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CNZI, PCNA and Cyclin Bl. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                           New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1

The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as udcerative collitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes a novel process (M1) of reverse transcribing mRNA species present in a sample from an organism by: (a) reverse mRNA species present in a sample from an organism by: (a) reverse cranscribing the mRNA species using a first heeled primer, to provide a first strand cDNA species and (b) synthesizing second cDNA species of the card inside a second heeled primer population, the nucleotide sequences of the non-heel portions of the second heeled primers being such that the crow-rese transcribed first strand cDNA species can be used for expression conformance and a heel sequence 5' can be used for the reverse transcription of mRNA species in a sample. The polynucleotide primer oppulation of claim (4) can be used for the synthesis of second strand cDNA species. Single cell cDNA.

Conformation a population of first strand cDNA species. Single cell cDNA.

Conformation of claim (4) can be used for the synthesis of second strand cDNA species. Single cell cDNA.

Conformation of claim (4) can be used for the synthesis of second strand cDNA species. Single cell cDNA.

Conformation of claim (4) can be used for the synthesis of second allow and the discovery of novel genes. Small samples can be used available for complex issues. The invention provides a rapid, robust and reproducible can the using can be used for the analysis of gene expression the complex issues. The invention provides are limiting. Whilst in situ hybridization technique sprovide detailed information about the complex insues provide synthin asingle cells or small tissue samplists are limiting. An expression pattern of a gene in intact tissue the technique is can intact in a single to separation. The methods for the analysis of gene expression cellular expression pattern of a gene in intact tissue the technique of preparation. The methods presented in the disclosure provide a more consulting that even relatively low abundance mRNA species are transcribed in the analyzed. There is a bias covards more uniform the primers described in the abu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse transcription of mRNA species used for expression profiling of single cells by employing a first heeled primer to provide first strand CDNA species and then a second heeled primer population to generate second strand cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Novel antisense compounds targeting nucleic acid encoding groEL or groES gene of microorganism, which hybridize with and inhibit expression of the genes, useful to inhibit growth of microorganism having the genes -

Claim 3; Page 52; 110pp; English.

The present invention specifically claims AAH56368 to AAH56812 which are antisense oligonucleotides to nucleotide sequences encoding groE. More generally, antisense compounds (1) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a nicroorganism, where the antisense compound is complementary to GL or GS of a nicroorganism and specifically hybridises with and inhibits the antiprolliferative activities, and can be used in antisense therapy and for inhibition of expression of GL or GS in cells or tissues in vitro. (I) are antiprolliferative activities, and can be used in antisense therapy and for inhibition of expression of GL or GS in cells or tissues in vitro. (I) are also useful for inhibiting the growth of a microorganism, or inhibiting the growth of a microorganism, or inhibiting the growth of anticoorganism, or inhibiting the growth of anticoorganism or to a cell infected with the microorganism of to a cell infected with the microorganism pathological condition mediated by microorganism pathological condition mediated by microorganisms which involves identifying a eukaryotic organism by the midroorganisms which involves identifying a condition mediated by the provent or delay microbial infected with the microorganisms having a gloof condition mediated by microorganisms which involves identifying a cloor or declay microbial infected with the growth of microorganism is inhibited. The antiense compounds are utilised for diagnostics, the microorganism ship involves in humans. They are also useful as molecular weight markers. AME6362 to AME66357 and AME68370 represent exemplification of the present invention. AME68870 represent

Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases -

Example 1; Page 204; 408pp; English.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (WMP). cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antisebortheic, antidiabetic, antisickling, obthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytchine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing prematuring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AMESTST7 to AMH62099 represent sequences used in the exemplification of the present invention.

                                                            Synthetic.
```

The present invention describes methods of increasing the number of nucleic acid sequences corresponding to an mRNA present in a sample using heeled primer sequences in amplification reactions. This is useful in the detection and cloning of low copy number mRNAs in a sample, in expression profiling and in high throughput systems.

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrone p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits

Example 2; Page 100; 714pp; English

This invention relates to the sequence of an isolated mucleic acid molecule comprising at least one base variation from that of a known human cytcochrome P450 Al (CYP4501A1), Cytcochrome P450 A2 (CYP4501A2), aryl bydrocarbon receptor nuclear translocator cytcochrome P450 02E1 (CYP45002E1), adrenergic receptor betal (ADBR1), aryl bydrocarbon receptor nuclear translocator (ARMY), cathepain 8 (CYS6), cytlocoxgenase 2 (CXX2), diazepam binding christing protein (FIAP), glutathione-S-transferase 12 (GYS12), cytlocoxgenase 2 (GXX2), diazepam binding cativating protein (FIAP), glutathione-S-transferase 12 (GYS12), cytlocoxgenase 2 (GXX2), diazepam binding cativating protein (FIAP), glutathione-S-transferase 12 (GYS12), unclaime-N-methyl transferase (HNMY), (Kallikrain 2) KIXZ, nicothiamide cylocarbor transferase (HNMY), MadpH quinone oxidoreductase 2 (KXX2), cylocarbor transferase (HNMY), multidung resistance associated (GYS2), or papalucuronosyl transferase 28 (GYS2N), unclained and cylocarbor transferase (HNMY), multidung resistance associated protein 3 (KRP2), orphan muclear receptor (UR12), or acetylcholine protein 3 (KRP2), orphan muclear receptor (UR12), or acetylcholine protein 3 (KRP2), orphan muclear receptor (HNI2), or acetylcholine characterising the genes that are responsible for a protein 3 (KRP2), orphan muclear transpension, constitutive expression, multiply as are useful of their early of diazorder-related traits as a result of their early of diazorder-related traits as a result of their early of diazorder-related traits as a result of their early of diazorder-related traits as a result of criat are conserved on unclaimed in CYP4501A1, CYPP4501A2, CYP4501A2, CYP4501A2, CYP4501A2, CYP4501A2, CYP4501A1, CYPP4501A2, CYP4501A1, CYPP4501A2, CYP54501A2, CYPA501A2, CYPA501A2, MULTIP, MULTIP

The invention relates to human CCR4 protein 10 (AAMS2938), nucleic acids encoding it (ABA02440), and a method for the recombinant production of CCR4 protein 10. The protein las a molecular weight of 10 kD. The protein last a molecular weight of 10 kD. The present invention additionally discloses an antagonist of CCR4 protein 0. for therapeutic use, and an antibody which specifically binds to CCR4 protein 10. CR4 protein 10, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polymucleotide can be used as primer for nucleic acid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences ABA02441 raBA02442 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human CCR4 protein 10 cDNA.
                                                                                                                                                                                                                                                                                                                                                                           Human CCR4 protein 10 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cross-linking oligomer 702 for targetting Herpes Simplex Virus I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of human MGC-2413.31. The sequences can be used in the treatment of cancer, haemopathy, development disorders, HIV infection, immune disorders and inflammation. The present sequence is a PCR primer for the coding sequence of the invention.

                            This oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. Residues 11 and 12 are linked via an o-xyloso group (i.e. nucleotides that have xylose sugar linked via the o-xylene ring). The sequence is designed to target the Herpes Simplex virus I beginning at nucleotide 10996 and to covalently cross-link to it. See also AAQ20151-Q20161.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major grove of the duplex. The specific target sequence of this oligomer is a herpes simplex virus I duplex beginning at nuclectide 10996 contg. a purine-rich region concentrated on concentrated on chain of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. respiratory syncytial virus, HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso (mucleotides have the 3 positions of xylose sugars linked via the o-xylene ring). Two contiections are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major growe of the duplex. The specific target sequence of this oligomer is a herpes simplex virus I target duplex concentrated on one chain of the duplex. The oligomer, and others concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. respiratory syncytial virus, HIV, hepacifits, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer may contain an inverted polarity region formed from an overload of duper synthom. The linking gp. is o-xyloso (nucleotides have the 3' positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthom. This additional modification may render the oligomer stable to muclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQX5452-25501 and AAQ30226-448.

Probe; hepatitis b virus; HBV detection; RT pol region; genetic analysis; precore region; HBSAg region; genotype specific target; mutation detection; ss.

Synthetic. Hepatitis b virus.

WO9740193-A2.

30-0CT-1997

Probe HBPr257 for RT pol region of HBV.

(first entry)

19-MAY-1998

AAV14091;

AAV14091 standard; DNA; 18 BP.

RESULT 307

```
The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major grove of the duplex. The specific target sequence of this oligomer is the human interleukin -1 beta gene beginning at nucleotide 6379 contg. a purine rich sequence concd. on one strand of this oligomer, and others like it are useful in diagnosis and therapy of disease characterised by specific DNA diagnosis and therapy of disease characterised by specific DNA duplex targets, e.g. HPV; HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions tumours and inflammation without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso funcleotides have the 3' positions of xylose sugars linked via the co-xylone ring). Two nucleotides are compled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems.

This sequence represents a probe for the RT pol region of hepatitis

b virus (HBV). This sequence can be used in the method of the invention

cor detection and/or genetic analysis of hepatitis B virus (HBV) in a

sample. The method comprises: (a) optionally releasing, isolating or

concentrating polynucleic acids (1) in the sample, and amplifying the

concentrating polynucleic acids (1) in the sample, and amplifying the

concentrating polynucleic acids (1) in the sample, and amplifying the

concentrating polynucleic acids (1) in the sample, and amplifying the

concentrating polynucleic acids (1) with a combination of at least 1

concentrating polynucleic acids (1) with a combination of at least 1

contract and hybridise specifically to mutant carget sequences chosen from

the HBV RT pol gene region, HBV precore region, HBASHG region and/or HBV

concentrations; (a) detecting the hybridis complements or U for T

concentration hybridisation signal(s). The composition can be used to

differential hybridisation signal(s). The composition can be used to

diagnose and/or monitor HBV mutants and/or genotypes in a sample,

concentrations selected by treatment with drugs, e.g. lamivudume and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

This sequence represents a probe for the RT pol region of hepatitis

b virus (HBW). This sequence can be used in the method of the invention

c for detection and/or genetic analysis of hepatitis B virus (HBW) in a

sample. The method comprises: (a) optionally releasing, isolating or

concentrating polymucleic acids (1) in the sample, and amplifying the

relevant part of a suitable HBW gene in the sample with at least 1

culevant part of a suitable HBW gene in the sample with at least

culevant part of a suitable HBW gene in the sample, and amplifying the

culevant part of a suitable HBW gene in the sample, and amplifying the

culevant part of a suitable HBW gene in the sample with at least

culevant part of a suitable HBW gene in the accentions on a solid

support and hybridis especifically to mutant suggest sequences chosen from

the HBW RT pol gene region, HBW precore region, HBRA region and/or HBW

centype specific target sequences, or their complements or U for T

concloques; (c) detecting the hybrids formed in step (b), and inferring

the HBW genotype and/or mutants present in the sample from the

differential hybridisation signal(s). The composition can be used to

diagnose and/or monitor HBW mutants and/or genotypee in a sample,

specifically genotype, precore mutations and

RT gene mutations selected by treatment with drugs, e.g. lamivudume and Sequence 18 BP; 7 A; 0 C; 4 G; 7 T; 0 other; Claim 5; Page 32; 80pp; English

Detection and/or genetic analysis of hepatitis B virus - specifically genotype, preCore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs

Claim 5; Page 32; 80pp; English.

This sequence represents a probe for the RT pol region of hepatitis by virus (HBV). This sequence can be used in the method of the invention cor detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releading, isolating or concentrating polymucleic acids (1) in the sample, and amplifying the cencentrating polymucleic acids (1) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample with at least 1 suitable primer pair; (b) hybridising (1) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV precore region, HBSA region and/or HBV genotype specific target sequences, or their complements or U for T proposes; (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the differential hybridisation signal (8). The composition can be used to differential hybridisation signal (8). The composition can be used to specifically genotype, precore mutations, vaccine escape mutations and control of the matations selected by treatment with drugs, e.g. lamivudune and Senciclovir.

The amplification product was used in an example of genetic screening method for diseases associated with coronary arterial spasm, which comprises determining if 1 or more specific nucleotides in the eNOS gene have been substituted, specifically G894T, C774T, T(-786)C, A(-922)G and T(-1468)A. Screening for diseases associated with coronary spasm, e.g angina pectoris, cannot be easily carried out by existing methods, this method allows rapid and easy detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotide HAdA3MM1, targeting adenosine A3 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Secondary structure; mRWh; phosphorothioate backbone; G-protein; bronchoconstriction; lung inflammation; asthma; pulmonary disease; allergy; emphysema; cystic fibrosis; ss.

                                                                                                                                                                                                                                                                                                                                                      Sequences AAV36356 and AAV36358 are anti-sense oligonucleotides used as mismatched controls to target the human adenosine A3 receptor and thus test the other oligonucleotides, AAV36355 and AAV36357 respectively, the design of which required the secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined sequence, thus causing the test can be used to decrease. The antisense oligonucleotides were targeted they can be used to decrease. The antisense oligonucleotides were targeted to specific many average their approach to decrease. The antisense oligonucleotides were targeted is a member of the G-protein coupled family of cell surface receptors is a member of the G-protein coupled family of cell surface receptors to treat or prevent conditions associated with bronchoconstriction and/or lung inflammation in humans or other animals e.g. asthma, pulmonary disease, allergy, emphysema and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a proteinaceous substance that comprises at least one stretch of amino acids derived from a first organism, capable of attaching to a cell wall of a second microorganism. The proteinaceous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New proteinaceous substance comprising a sequence consensus to a major peptidoglycan (AcmA), useful for attaching a substance to a cell wall

cc substance is useful in a method for attaching a substance to the cell wall of a microorganism, and the substance and either microorganism are useful in pharmaceutical compositions and vaccines, for delivery of a substance to a cell. They are also useful in diagnostic tests, constanted to constant and in foodstuffs. The new method targets bloadscrotton processes and in foodstuffs. The new method targets ambatances to cells of a wide range of microorganisms, unlike prior art and nardeting proteins which are specific and selective for a limited set of microorganisms, which are usually recombinant or consensus, preventing restrictions on applications, and preventing consential problems of colonisation of the mucosal surfaces which can ceause immune tolerance. Public consensus is against use of recombinant or attenuated strains, so the new technique is more likely to be accepted than prior art methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CYP3A4 gene polymorphism; polymorphic locus; human; altered metabolism; CYP3A4 substrate; drug-drug interaction identification; toxin exposure; genetic linkage detection; phenotypic variation; promoter; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
```

This sequence represents a PCR primer for the human CYP3A4 gene promoter. The invention relates to a CYP3A4 sequence polymorphism, which is part of a non-naturally occurring chromosome. Nucleic acids comprising the CYP3A4 polymorphic sequences can be used to screen partents for altered metabolism for CYP3A4 substrates, potential drug-drug interactions, and adverse/side effects as well as diseases that result from environmental or occupational exposure to toxins. They can also be used to establism animal, call culture and in vitro cell-free models for drug metabolism. Polymorphic CYP3A4 gene sequences can be used for expression studies to determine the effect of promoter and/or intron

sequence variations on mRNA expression and stability. The polymorphisms are also used as single nuclectide polymorphisms to detect genetic linkage to phenotypic variation in activity and expression of CYP3A4. The nucleic acids can also be used to generate genetically modified non-human animals or site specific gene modifications in cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7740 represent amplification primers for the biallelia markers. The biallelia markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as weil as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel biallelic markers used to construct a high density disequilibrium map of the human genome -

The methods are useful for inhibiting Type III secretion of proteins by Yersinia (especially Yop proteins which allow Yersinia to evade phagocytic killing by macrophages) and other Gram-negative bacteria, where the antisense oligonucleotide of a Gram-negative bacterium. The Gram-negative bacterium a secretion signal of a secreted protein of a form-negative bacterium. The Gram-negative bacterium spp. Schedida coli, Salmonella spp., Shigella spp., Beckerichia coli, Salmonella spp., secretion of proteins is useful for enhancing a hosts defenses against such bacteria. The methods also provide a means for screening for compounds, which block or inhibit the type III secretion.

The methods are useful for inhibiting Type III secretion of proteins by Yersinia (especially Yop proteins which allow Yersinia to evade phagocytic killing by macrophages) and other Gram-negative bacteria, where the antisense oligonucleotide binds a portion of mRNA encoding a secretion signal of a secreted protein of a Gram-negative bacterium. The Gram-negative bacterium that can be targeted include Yersinia spp., Bscherichia coli, Salmonella spp., Shigella spp., Pseudomonas spp. and Xanthomonas spp. Inhibiting Type III secretion of proteins is useful for enhancing a hosts defenses against compounds, which block or inhibit the type III secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                      The invention relates to a method of inhibiting Type III secretion of proteins by Yersinia by contacting the cell with an antisense oligo that binds at least a portion of mRNA encoding the first 15 amino acids of either the wild-type Yops or YopN protein. The methods are useful for inhibiting Type III secretion of proteins by Yersinia (especially Yop proteins which allow Yersinia to evade phagocytic killing by macrophages) and other Gram-negative bacteria, where the antisense oligonucleotide binds a portion of mRNA encoding a secretion signal of a secreted protein of a Gram-negative bacterium. The Gram-negative bacterium is a secreted protein targeted include Yersinia spp. Bscherichia coli, Salmonella spp., Scherichia coli, Salmonella spp., secretion of proteins is useful for enhancing a hosts defenses against such bacteria. The methods also provide a means for screening for compounds, which block or inhibit the type III secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of inhibiting Type III secretion of proteins by Yersinia by contacting the cell with an antisense oligo that binds at least a portion of mRNA encoding the first 15 amino acids of either the wild-type Yopk or YopN protein. The methods are useful for inhibiting Type III secretion of proteins by Yersinia (especially Yop proteins which allow Yersinia, where the antisense oligonucleotide binds a portion of mRNA encoding a secretion signal of a secreted protein of a carm-negative bacterium. The Gram-negative bacterium is secreted protein of a carm-negative bacterium. The Gram-negative bacterium for Shigella spp., Schlerichia coli, Salmonella spp., Shigella spp., Redendomonas spp. and Xanthomonas spp. Inhibiting Type III secretion of proteins is useful for enhancing a hosts defenses against compounds, which block or inhibit the type III secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; glutamate carboxypeptidase II; GCPII gene; dietary folate; FGCP; folypoly-gamma-glutamate carboxypeptidase; hyperhomocyteinaemia; cardiovascular disease; Alzheimer's disease; neural tube defect; congenital heart defect; colon cancer; PCR primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Η
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening an individual for increased risk of low folate status, comprises detecting mutation in human glutamate carboxypeptidase Ilgene which affects ability of hydrolyzing terminal glutamates from dietary folates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                             Antisense oligonucleotide inhibition useful for suppression of virulence and improvement of host defense mechanisms such as phagocytosis -

The patent discloses methods for screening an individual for increased risk of low folate status. The method involves detecting a mutation in the human glutamate carboxypeptidase (GCP) I gene in a biological sample from said individual, wherein detection of the mutation is indicative of decreased ability of an individual to hydrolyse terminal glutamate residues from dietary folates by folypoly-gamma-djutamate carboxypeptidase (FGCP), a product of GCPII gene. The decreased ability is associated with low folate status. The method is useful for screening an individual for increased risk of low folate status and conditions an individual for increased risk of low folate status and conditions cancer and altered cognition in the elderly including Alzheimer's disease. Pregnant women with low folate status are at increased risk of bearing children with neural tube defects and congenital heart defects. The present DNA sequence is a PCR primer which is used for amplifying exon-4 of GCPII gene. This primer is designed from PSNA genomic sequence and is used for detecting a mutation in GCPII gene.
                                   Example 5, Page 26, 38pp; English.

Novel isolated cis-acting regulatory nucleic acid sequence comprising 3'-untranslated region of parathyroid hormone gene useful in gene therapy for treating pathological condition such as chronic renal therapy

Example 1; Page 39; 83pp; English.

The present sequence is that of a 3' PCR primer used in the amplification of a 40 nucleotide transcript, which was used in the construction of a plasmid containing rat parathyroid hormone (PTH) cDNA. Cis-acting sequences (see AAH26198-211) comprising fragments of the 3' untranslated region of mammalian PTH genes, or allelic variants, mutants or functionally equivalent

fragments, can be linked to a heterologous or homologous coding sequence of interest, and direct specific regulation of stability of the mRNA encoded by the linked coding sequence. The regulation of the stability of the mRNA is responsive to changes in serum levels of any one of calcium and phosphate and is further mediated by the binding of at least one parathyroid protein or its derivatives to the cis-acting sequence. A pharmaceutical composition for the cis-acting sequence. A pharmaceutical composition for the cis-acting sequence. A pharmaceutical composition for function of the parathyroid gland or abnormal metabolism of calcium and/or phosphate comprises parathyroid protein or an agent that binds to the cis-acting element. It is useful for preventing and/or treating over- or underproduction of PTH, bone diseases, contracting over- or underproduction of PTH, bone diseases, and for treating sequence with a coding sequence is useful in gene therapy. 88888888888888888888

8 Primary nucleotide sequence of the shrimp white spot Bacilliform (WSBV), useful for producing viral polypeptides that can be used screen for agents that are useful for treating WSBV infection -

Disclosure, Figure 3; 626pp, English.

genome The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG84010-AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to

BP.

```
The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor-indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors and adaptor-indexers
                                                                                                                                                                                                                                                   Binary encoded sequence tag; BEST; nucleic acid analygis; gene expression; adaptor; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is one of a number of antisense compounds of up to 30 rucleobases in length targeted to a nucleic acid encoding human Akt-3. The antisense compounds are useful for inhibiting the expression of human Akt-3 in human cells or tissues. They are also useful for modulating the expression of Akt-3, and for treating a human or an animal suspected of having, or being prone to, a disease or condition associated with Akt-3 expression. The antisense compounds may also be used as research reagents, in kits and in diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of a biological pathway; and as a prophylactic, e.g. to prevent or delay infection, inflammation or tumour formation.
                                                                                                                                                                                  ö
gene expression in infected cells and tissues and to create

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/I/L, V18ICI, MISBUYI, Y18BL, G190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes of the function together in a reverse-hybridiastion assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/I/L, Y18IC/I, Q151M/L, M184V/I, Y188L, G190A/S/R and/or the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of antiviral drug resistance or mutations associated with crepresent HIV RT sequences and probes which are used in the expression of the present invention.
                                                                                                                                                                                                                                                                                                         Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay —
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18 BP; 11 A; 2 C; 2 G; 3 T; 0 other;

Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them -

Claim 10; Page 124; 345pp; Japanese.

The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucletides (AR150512-AR151809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved mucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of pancraes, tansplantation e.g. of bone marrow, kidney, liver, pancraes, Langerhans islet in pancrees and cornea, susceptibility diagnosis of genetic diseases and identifying individuals.

Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability -

Examples; Column 1093; 588pp; English

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, BST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat in the computational methods (polymorphic cuseful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases, linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredrach's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in human ESTS.

Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides -

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a bological sample obtained from the subject with at least 1 reagent, which distinuishes between methylated and non-methylated CpG dimucleotides within the target nucleic acid. ABZ09861 to ABZ01818 represent specifically claimed nucleotide sequences from the present invention can be used: for invention. Oligomicleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia, as probes for determining the cyrosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder complements; and as primers for the ampliteration of haematopoietic cell proliferation disorder related manipulation of haematopoietic cell proliferation disorder related on the seading a predisposition to, differentiation between the subjectic cell proliferation disorder related consultations; processed from the present invention can also be used for detecting a predisposition to, differentiation between the haematopoietic cell proliferative disorders. The present method enables hamply specific classification of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables and disorders allowing for improved and informed treatment of patients.

Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single nucleotide polymorphisms and cytosine designed to detect methylation status

Claim 1; SEQ ID 18139; 29pp + Sequence Listing; German

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and
oligomers are also used for detecting cell type differentiation.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE39399, ABF00010-ABE93999, ABF00010-ABE99999 and and SABIG0010-ABE182073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABH99989 and ABI00010-ABH99973 represent the oligomers described in the invention. ANOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Set of oligonucleotides, useful for diagnosis and call typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligonucleotide SEQ ID NO 19458 for detecting SNP TSC0004047.
                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID 19457; 29pp + Sequence Listing; German.

This invention describes novel oligonuclectide primers or peptide nucleic acid (FWA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DWA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABH00010-ABH99999 and ABC0010-ABE99989, ABH00010-ABH99999 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SMP) and cytosine methylation status in chemically pretreated genomic DMA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The accounted nervous system, cardiovascular and metabolic disorders. The ABC00010-ABE099999, ABP00010-ABH999999 and ABI00010-ABE099999, ABP0010-ABH999999 and ABI00010-ABE099999, about of the printed specification, but was obtained in electronic format from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, carditoraccular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                ABC20821;
```

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytoshism methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

typing, i

Set of oligonucleotides, useful for diagnosis and cell designed to detect single nucleotide polymorphisms and methylation status

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABF99989, ABF00010-ABF9989, ABH00010-ABF99989 and ABI00010-ABF8987 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed appecification, but was obtained in electronic format from WIPO at

The oligomers are also used for detecting cell type differentiation.
ABC00010-ABC9989, ABR0010-ABF9989, ABR001010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
oligonucleotides are used for diagnosis and/or prognosis of cancer and a

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABH0010-ABE99989 and ABM0010-ABE99989 and ABM0010-ABE9998 and ABM0010-ABE9998 and ABM0010-ABE9998 and begingener described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABC00010-ABE09995, ABF00010-ABE9989, ABH00010-ABH99999 and ABI00010-ABE99995, The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABE9989, ABF00010-ABE9989, ABF00010-ABE9989, and ABC0010-ABE9989, and the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligozers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. Set of oligonuclectides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 30128; 29pp + Sequence Listing; German.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, entral nervous system, artiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

Set of oligonuclectides, useful for diagnosis and cell typing, idesigned to detect single nuclectide polymorphisms and cytosine Oligonuclectide SEQ ID NO 37563 for detecting SNP TSC0011693 Claim 1; SEQ ID 37563; 29pp + Sequence Listing; German Berlin K; 06-APR-2001; 2001WO-IB00713. 07-APR-2000; 2000DE-1019173. Olek A, Piepenbrock C, (BPIG-) EPIGENOMICS AG WPI; 2001-657177/75. designed to detect methylation status WO200177384-A2. Homo sapiens 18-0CT-2001.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic discorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABR00010-ABC99899, ABR00010-ABC99899 and ABL00010-ABC99899 and ABC00010-ABC99899, and cell type differentiation. WOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the wipo.int/pub/published_pct_sequences. This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABR29989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABR29989, ABF00010-ABF99989, ABH00010-ABH99989 and specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format from WIPO at the vipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE09999, ABF00010-ABE9999 and ABE000010-ABE09073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID 37956; 29pp + Sequence Listing; German

Set of oligonucleotides, useful for diagnosis and cell typing, idealgned to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 40573; 29pp + Sequence Listing; German

```
ö
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABP9989, ABH00010-ABH9989 and ABI0010-ABH9989, ABF00010-ABH9989 and MOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fitp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                     Gapa
                                                                                                                                                                                                                                                                                                                                                                                                     ö

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 40574; 29pp + Sequence Listing; German.

This invention describes novel oligomucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardicvoscullar and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC39989, ABC0010-ABC9989, ABH00010-ABC99989, ABH00010-ABC99989, ABH00010-ABC9989, ABH00010-ABC9989, ABH00010-ABC90030 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pot_sequences. schultz143-3.rng

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted gencalic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.
ABC00010-ABC99989, ABR00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABG9989, represent the oligomers described in the invention.
NOTE: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 13 BP; 4 A; 0 C; 1 G; 8 T; 0 other;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cartain nervous system, ardiovascribar and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ARC0010-ABR99989, ABR0010-ABR99899, ABR0010-ABR99899 and ABR0010-ABR99899, ABR0010-ABR99989 and halloudle-ABR99989. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fip.wipo.int/pub/published_pct_sequences.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, azdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 61536; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences. #X###X#X9999999999
